

New Alfons Haar Product Return System

Alfons Haar

Compartment COP

Now, with the loading plan and full compartment control handled by the X-MASTER, accidental cross-contamination during product return is eliminated.

Stock reconciliation by flow rate and time window monitoring

All product flows are measured and all flow directions are controlled, with the loaded quantities stored in each compartment. This means that the X-MASTER can reconcile all residual quantities in each compartment - including all product return operations !

Tamperproof product return

The new, patented, flow check system is designed to only detect flow of product through the product return connection. Manipulation, for example with compressed air, will not produce a valid signal to the X-MASTER.
